1 Prime numbers

- What are prime numbers ?
- There is no largest prime numbers

What Are Prime Number ?

Definition

A prime number is a number that has exactly two divisors

Exemple

- 2 is prime (two divisors: 1 and 2)
- 3 is prime (two divisors: 1 and 3)
- 4 is not prime (three divisors: 1, 2 and 4)

There Is No Largest Prime Numbers

The proof uses reductio ad absurdum.

Theorem

There is no largest prime numbers

Proof

- 1 Suppose p is the largest prime number.
- 2 Let q the product of the first p numbers.
- 3 Then $q + 1$ is not divisilbe be any of them.
- 4 But $q + 1$ is greater than 1, thus divisible by some prime numbers not in the the first p prime number.

An Algorithm For Finding Prime Numbers.

```
int main (void)
{
    std::vector<bool> is_prime (100, true);
    for (int i = 2; i < 100; i++)
        if (is_prime[i])
        {
            std::cout << i << " ";
            for (int j = i; j < 100; is_prime [j] = false, j+=i);
        }
    return 0;
}
```

Note the use of **std::** .
